Live Webcasting For All

Since 2009, VirtualEyz has been turning your green and blue backdrops into live webcam feeds for Flash-enabled webcasting.

Power to the People

Starting with version 2.0, VirtualEyz expands to 3 live channels of chroma-key (greenscreen/bluescreen) capability with a single switched virtual camera output. It's effectively a 3x1 video switcher with a chromakey and color corrector on every input channel.

Easy, Familiar Controls

VirtualEyz is "just a Mac app", with familiar controls. The camera input select is simply a popup containing the names of cameras attached to the Mac. The color correction controls are very similar to iMovie, so anyone familiar with that ubiquitous application will be immediately at home with VirtualEyz. The virtual camera driver can be installed and removed from within the app itself. After all, it's a drag install.

Ultimate Compatibility

VirtualEyz outputs a live video feed using AVFoundation and QuickTime(tm) compatible drivers plug-in. The driver makes VirtualEyz output appear as if it is "yet another built-in camera" in the system. So most standard camera applications on the Mac will simply be able to use the live video output as if it were a single camera.

Supports Standards

VirtualEyz works with almost all USB webcams (Logitech et al), the built-in FaceTime HD and iSight cameras and most other cameras which work with QuickTime and AVFoundation.

VirtualEyz supports most image types for use as virtual set backdrops.

Inexpensive

Unlike other solutions on the market which can cost upward of \$500 per computer, VirtualEyz is priced for the average Mac user. Pick up a few inexpensive USB webcams from your local Fry's and you can be broadcasting with multiple cameras for under \$150.00.

AT A GLANCE

- 3x1 video switcher.
- Channel in contrast, brightness and exposure.
- Matte extraction from arbitrary color.
- Works with all Intel based Macs.
- Connect up to 3 inexpensive USB cameras.
- Live broadcasts and screencasts.
- Works with Flash-enabled websites.
- Works with 64-bit Safari.
- Works with Google Chrome & Hangouts.
- Works with QuickTime & Broadcaster.
- Record output to QuickTime movie with Quicky or Quickier (also from b-l-a-c-k-o-p.com).

INPUTS

- External camcorders compatible with QuickTime(tm) and AVFoundation/CoreMedia.
- Most USB UVC cameras including Logitech.
- Apple FireWire cameras.
- Most DV Camcorders.
- GrabberRaster for screen-casting (sold separately).

OUTPUTS

Streaming Output - push your live feed into other Mac apps or stream to the global internet.

- **CoreMediaIO** - output compatible with all AVFoundation camera apps including Apple Photo Booth (Lion and Mountain Lion). CMIO drivers are the most up-to-date modern media architecture available from Apple.
- **QuickTime VDIG** - compatible with QuickTime enabled camera applications. The industry standard for camera devices prior to the introduction of AVFoundation (pre-2011).
- **CoreImage** - sends output to QuickLook, Quartz Composer and many other standard Mac applications.

SYSTEM REQUIREMENTS

Compatible with all Intel Macs.

Intel CPU with Snow Leopard 10.6.8, Lion 10.7.5, Mountain Lion 10.8 and Mavericks 10.9.

Works best with multi-core processors and NVidia GPU Macs.

SUPPORT

Free technical support is available for the first 30 days after purchase. Limited, ongoing support is available by email.

PRICING

We generally fix all bugs that customers report.

\$59	VirtualEyez 2.0
\$30	Upgrade from earlier versions.

Subscriptions (works like AppleCare)

\$99	3 year subscription.
\$149	Lifetime subscription.

Educational and volume discounts are available.
